EDUCATION

Bachelor of Engineering in Information Science *Sept 2023 – May 2027*

BMS Institute of Technology and Management, Bengaluru **CGPA : 8.15**

PROFILE SUMMARY

Information Science Engineering student specializing in cybersecurity engineering, vulnerability assessment & management, and threat & risk modeling. Experienced in building DevSecOps pipelines, detection engineering mapped to MITRE ATT&CK, and security automation for enterprise-scale infrastructure. Holding active cloud certifications and hands-on experience with secure software engineering practices, incident response tooling, and security governance controls.

SKILLS

Languages:	Python, Java, C, SQL
Databases:	MySQL, MongoDB
Frameworks & Libraries:	FastAPI, Pydantic, Scikit-learn, XGBoost, SHAP, LIME
Tools & Platforms:	Git, Docker, Jenkins, Trivy, Gitleaks, HashiCorp Vault, CI/CD, Splunk (SIEM)
Security & Domain Knowledge:	MITRE ATT&CK, EDR, OSINT, Incident Management, REST APIs, Gemini LLM

EXPERIENCE

AI Security Research Intern, EvoluteIQ

- Assessed open-source LLMs across 2 local-hosting platforms (Ollama, Open WebUI) to benchmark security posture, retrieval quality, and model behavior for enterprise deployment readiness.
- Configured a Qdrant-backed vector database to build and validate Retrieval-Augmented Generation (RAG) workflows against custom knowledge bases, supporting secure data handling practices.
- Modeled and simulated attack categories from the OWASP Top 10 for LLM and Agentic AI Applications, applying targeted mitigation and control design for each threat vector.
- Documented security governance documentation across 4 deliverable areas (attack methodology, mitigation strategy, evaluation results, implementation guidance) to support secure LLM deployment standards.

PROJECTS

Secure LLM API Key Vault: Envelope Encryption Gateway *2026*

FastAPI | HashiCorp Vault | PostgreSQL | Redis | Docker Compose

- Prevented plaintext credential exposure from a database compromise alone, as measured by zero recoverable API keys under a stolen-database scenario, by architecting an AES-256-GCM envelope encryption gateway on HashiCorp Vault's Transit engine.
- Eliminated standing root-token exposure across the system, as measured by scoped least-privilege access enforced on all 12 REST endpoints, by implementing per-token Vault authorization, Argon2id password hashing, and a fail-closed design that returns HTTP 503 instead of falling back to unencrypted storage.
- Automated security verification on every commit and pull request, as measured by 4 parallel CI checks (pytest, Bandit SAST, pip-audit, Gitleaks) plus frontend dependency auditing, by building a GitHub Actions DevSecOps pipeline.

Endpoint Attack Reconstruction Engine *2026*

Python | Sysmon | Splunk | Windows Event Logs | MITRE ATT&CK

- Enabled detection of PowerShell abuse, LOLBin execution, persistence, and reconnaissance activity, as measured by 4 rule-based detection modules mapped to 12+ MITRE ATT&CK techniques, by engineering a Windows EDR pipeline on Sysmon and Windows Event Log telemetry.
- Reconstructed complete attack chains from fragmented endpoint telemetry, as measured by a 5-index Splunk schema and 6 dashboards correlating events via ProcessGuid-based grouping, by architecting a correlation engine with sliding time-window grouping and DAG-based process-tree reconstruction up to 20 levels deep.
- Ensured safe, auditable automated response to detected attacks, as measured by allowlist-enforced process termination with zero hardcoded credentials across all modules, by implementing a deny-by-default response engine with shell-injection prevention and PID validation.

Threat Intelligence Aggregator SOC Platform *2026*

Python | FastAPI | MongoDB | OSINT | MITRE ATT&CK | Pydantic

- Correlated indicators of compromise across three independent OSINT feeds into a unified threat graph, as measured by a nine-stage pipeline (collect, normalize, enrich, correlate, MITRE-map, risk-score, alert, summarize), by building async collectors for AlienVault OTX, Abuse.ch, and OpenPhish.
- Prevented duplicate nodes across repeated collection runs, as measured by a bounded 0-1 correlation strength score weighted across four independent signals (IOC type, source feed, ASN, country), by designing content-derived event and correlation IDs with explicit guards against placeholder enrichment data.
- Detected real-time attack patterns from raw log traffic, as measured by three stateful behavioral rules (SSH brute force, active scanning, DNS tunneling) enforced via self-pruning time-windowed counters, by building a detection engine across 20+ rate-limited REST endpoints with strict Pydantic input validation.

CERTIFICATIONS & PROFESSIONAL DEVELOPMENT

- Oracle Cloud Infrastructure 2025 Architect Associate
- Oracle Cloud Infrastructure 2025 Generative AI Professional
